

PROJECT SYNOPSIS

Project Title: Business Name Generator Using Python

Prepared By: Sushma Rakesh

Project Overview: The Business Name Generator Using Python is a beginner-friendly mini project developed to generate creative and unique business name suggestions automatically. The program combines predefined words such as adjectives and business-related terms to create multiple business name options. This project helps in understanding the basic concepts of Python programming while building a simple and useful application.

Objective of the Project: The main objective of this project is to design a Python program that can generate business names by randomly selecting and combining words from different lists. The project also aims to improve understanding of Python fundamentals such as variables, lists, loops, string concatenation, user input, and the use of built-in modules like random.

Tools / Resources Used: • Python

- VS Code
- Random Module
- Command Prompt / Terminal

Features of the Project: • Generates creative business name suggestions automatically

- Uses random selection of words for name creation
- Can generate multiple name suggestions at once
- Beginner-friendly and easy to understand
- Helps practice basic Python concepts in a real-time mini project

Working of the Project: The program stores a list of adjectives and business-related words in separate Python lists. It then uses the `random.choice()` function to select one word from each list and combines them to form a business name. The program can repeat this process multiple times to display several business name suggestions to the user.

Conclusion: This project is a simple yet effective Python mini project that demonstrates the practical use of basic programming concepts. It is useful for beginners to understand how Python can be used to build small applications. The project can be further enhanced by adding user input, category-based name generation, duplicate avoidance, and GUI features.
